# Climate Change

# Rapid Urbanisation

# Increasing energy and resources needs

In November 2013, the Philippines was struck by typhoon Haiyan, one of the most powerful ever recorded and a devastating event that immediately captured the world’s attention. While natural disasters tend to dominate the headlines, there is also another story to be told about the Philippines. The country recorded GDP growth of 7.2% last year, comparable with 7.6% in other emerging countries, and 6.5% in advanced nations. The economy has become more robust, diverse and resilient over the past few years – propelled by a mix of domestic and foreign demand, a well established and balanced manufacturing industry, and a service sector. In step with the rest of Asia, the Philippines has become a more dynamic economy. Today, Asia is the engine of the world’s economic growth. The region’s GDP accounts for 30% of global GDP (and could reach as much as 50% towards 2050) and it is no overstatement to say that growth in Asia means growth for the world. A generation ago, Asia was a marginal region; now it’s at the centre of the global economy.

As Asia steps further into the limelight, it is clear to me that its politicians and people alike must take on more responsibilities. Once content to follow, Asia must now take the lead. That is why I believe the World Economic Forum on East Asia is taking place at a key moment in time. Participants will consider how best to secure sustainable economic growth through responsible business expansion, political and social development, as well as how the people of the region can enjoy better lives.

This is made all the more pressing by our current situation. In the 21<sup>st</sup> century, we face what I see as a ‘trilemma’, three pressing issues that must be solved simultaneously if we are to secure a workable, sustainable future; securing economic growth and accommodating population expansion; working with increasingly limited resources; and raising environmental awareness in order to deal with devastating weather events linked to climate change. This must be done at a time when the pace of social and political change has never been faster, and economic uncertainties and risk have never been greater; a time when “leveraging growth for equitable progress” – the theme of the Forum’s event in East Asia – is a vital concept for the business sector to embrace and cultivate.

Over the course of the meeting, I hope to see participants from governments, business, academic and independent organizations come together to identify the key challenges of our shared future, and to work towards securing sustainable growth in East Asia, and the wider world.

Of course, no single meeting can be expected to deliver solutions. I believe that to resolve our trilemma and secure fair, sustainable growth, we must boost innovation and productivity, and by we mean both governments and (most of all) private enterprises. Having said that, I also believe that collaboration across all sectors of society will play a significant role in the region’s development. We are all familiar with the concept of networking and the potential of cloud computing. I tend to see these meetings as the coming together of a human cloud that draws on the power and reach of a global network. I have every confidence that the interaction of this cloud will enlighten us as to how to achieve equitable progress for today’s world and the generations yet to come.

Author: Atsutoshi Nishida is Chairman of the Board, Toshiba Corporation, Japan, and a co-chair of the 2014 [World Economic Forum on East Asia](#).

# LAND USE

## ARC3

First UCCRN Assessment Report on  
Climate Change and Cities

### Risks

Land sensitivity factors:

- Natural setting, Urban form, Built environment
- Extent of heat island effect
- Adaptive capacity -- urban land management system including: legal/political, planning, land regulations, infrastructures and urban services, land markets, and fiscal systems

### Adaptation and Mitigation strategies

- Reduce sprawl, increase densities and mix uses to reduce auto use and increase public transit use
  - Change in building codes to reduce energy use for heating and cooling
  - Land use restrictions in areas subject to climate change impacts such as sea level rise
  - Changes to building codes/land regulations to reduce damage from climate change hazards, e.g., elevating buildings in flood-prone areas
  - Increase urban trees and vegetation to reduce the heat island effect

Source: Marco Schmidt, 2003

**Informal settlements on steeply sloped public land in Rio de Janeiro, Brazil**

**POLICY**

### Key takeaway

Urban land strategies highly dependent on coordination and effectiveness of planning and management systems in politically fragmented metropolitan areas

## SBE16 Tallinn and Helsinki Conference

Build Green and Renovate Deep

5-7 October 2016, Tallinn and Helsinki

Edward Ng

Compact living is sustainable living. High-density cities can support closer amenities, encourage reduced trip lengths and the use of public transport and therefore reduce transport energy costs and carbon emissions. High-density planning also helps to control the spread of urban suburbs into open lands, improves efficiency in urban infrastructure and services, and results in environmental improvements that support higher quality of life in cities.

Encouraging, even requiring, higher density urban development is a major policy and a central principle of growth management programmes used by planners around the world. However, such density creates design challenges and problems. A collection of experts in each of the related architectural and planning areas examines these environmental and social issues, and argues that high-density cities are a sustainable solution. It will be essential reading for anyone with an interest in sustainable urban development.

## PLANNING

# SBE16 Tallinn and Helsinki Conference

Build Green and Renovate Deep

5-7 October 2016, Tallinn and Helsinki

Edward Ng

Rapid urbanization, higher density and more compact cities have brought about a new science of urban climatology. An understanding of the mapping of this phenomenon is crucial for urban planners. The book brings together experts in the field of Urban Climatic Mapping to provide the state of the art understanding on how urban climatic knowledge can be made available and utilized by urban planners. The book contains the technology, methodology, and various focuses and approaches of urban climatic map making. It illustrates this understanding with examples and case studies from around the world, and it explains how urban climatic information can be analysed, interpreted and applied in urban planning. The book attempts to bridge the gap between the science of urban climatology and the practice of urban planning. It provides a useful one-stop reference for postgraduates, academics and urban climatologists wishing to better understand the needs for urban climatic knowledge in city planning; and urban planners and policy makers interested in applying the knowledge to design future sustainable cities and quality urban spaces.

- 20; 19; 18; 17; 16; 15
- 13; 12

Based on the Urban Climatic Planning Recommendation Map of HK, the re-zoning sites were reviewed by the Town Planning Board.

Urban Climatic Analysis Description	Urban Climatic Classes	Impact on Thermal Comfort	Urban Climatic Value / Sensitivity Zone	Urban Climatic Planning Zones and General Planning Recommendations
1 These areas are situated on the higher altitudes of mountains and steep vegetated slopes. Adiabatic cooling and wind convective cooling are prevalent to bring about good dynamic potentials and moderately negative thermal load. As a result, the temperature is usually very cool. These areas are sources of cool and down wind.	Moderately negative Thermal Load and Good Dynamic Potentials	Moderate	Urban climatically valuable area	Positive 1
2 These areas are extensively covered by natural vegetation, greenery, and natural cooling areas including the hilly slopes. Trans-ventilation cooling is prevalent to bring about good dynamic potentials and slightly negative thermal load. As a result, the temperature is generally cooler. These areas are sources of cool and fresh air.	Slightly negative Thermal Load and Good Dynamic Potentials	Slight	Slightly urban climatically sensitive area	Neutral 2
3 These areas usually consist of more spaced out developments with smaller ground coverage and more open space very near the sea. As a result, the temperature is mild.	Low thermal Load and Good Dynamic Potentials	Neutral	Moderate Urban climatically sensitive area	Moderate 3
4 These areas usually consist of low to medium building volumes in a developed yet more open setting, e.g. in the sloping areas with a fair amount of open space between buildings. As a result, the temperature is slightly warm.	Some Thermal Load and Some Dynamic Potentials	Slight	High urban climatically sensitive area	High 4
5 These areas usually consist of medium building volumes situated in low-lying areas further inland from the sea or in areas fairly sheltered by natural topography. As a result, the temperature is warm.	Moderate Thermal Load and Some Dynamic Potentials	Moderate	Very highly urban climatically sensitive area	Very high 5
6 These areas usually consist of medium to high building volumes located in low-lying development areas with relatively less urban greenery. As a result, the temperature is very warm.	Moderately High Thermal Load and Low Dynamic Potentials	Moderately strong		
7 These areas usually consist of high building volumes located in low-lying well-developed areas with little open space. As a result, the temperature is generally hot in these areas.	High Thermal Load and Low Dynamic Potentials	Strong		
8 These areas usually consist of very high and compact building volumes with very limited open space and permeability due to shielding by buildings on many sides. Full and large ground coverage is prevalent and air paths are restricted from the nearby sea or hills. As a result, the temperature is very hot in these areas.	Very High Thermal Load and Low Dynamic Potentials	Very strong

 — : Maintain or Protect the existing condition.

PLANNING

## Recommendation on Wind Aspect

1. Respect the cooling effect from the Eastern Chanshan; minimize the development's impact; and form air path from hillside to downtown areas.
2. Respect the cooling effect from the river; Building blocks with various height to allow the penetration of cooling effect from riverside to inner urban areas;
3. Respect the sea breeze penetration; Do not form the Wall Effect Buildings at the Harbour front;
4. N-S orientated main roads are important major air paths; Buildings should be orientated with respect to the major air paths (annual & summer).
5. W-E orientated main roads are important minor air paths, esp. in summer; Building should be orientated with respect to the minor air paths.

# PLANNING

## Recommendation on Water Aspect

1. Respect the cooling effect from water systems, including river, lake, ponds & seafront; minimize the development's impact at waterfront and landscape the waterfront.
2. Form cooling branches along major transportation links highlighted in light blue color in the right map; appropriate greenery or landscape designs along these branches are strongly recommended.
3. Link the Lian Ching Pond, Jinshih lake and Chengcing Lake by using greenery or vegetations to benefit the surround areas of these water bodies and mitigate the urban heat island intensity;

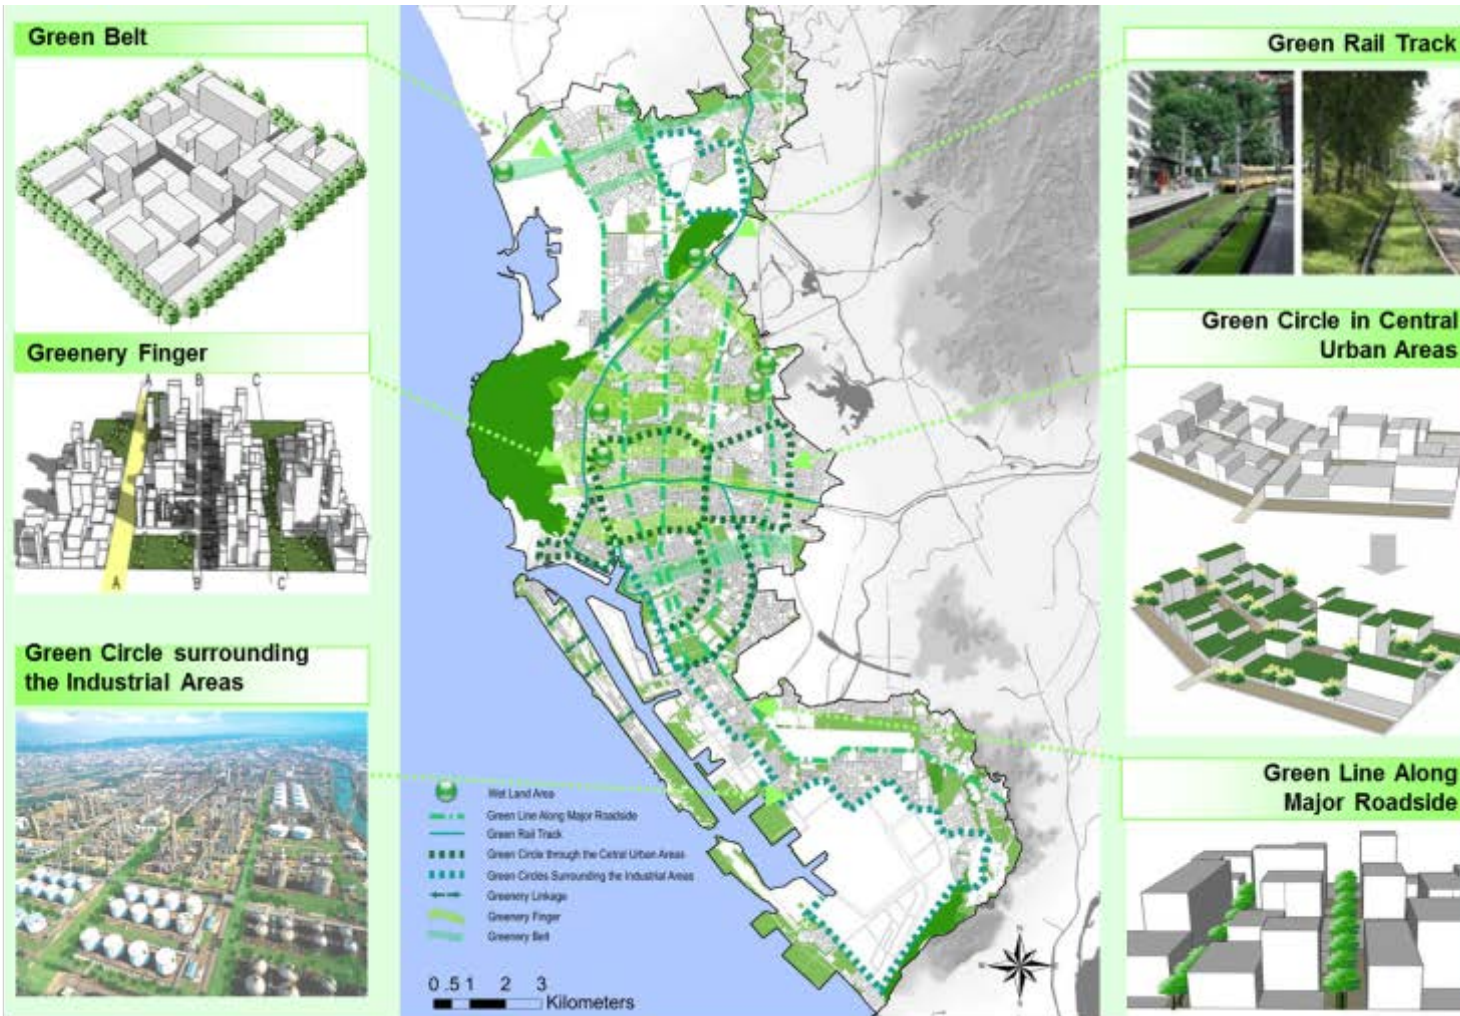

# PLANNING

## Recommendation on Greenery Aspect

1. Green rail track can be adopted to mitigate the anthropogenic heat release and air pollution along railways in dense urban areas;
2. Form green circles in the central urban areas to mitigate urban heat island intensity and anthropogenic heat releases. Provide shading at pedestrian level to create comfortable walking systems.
3. Form green circles around the industrial areas to mitigate the distribution of air pollution;
4. Create Green linkage between Chanshan, Lianchih Pond and Banpinshan to maximize the cooling effect;
5. Develop Green Fingers to let the cooling effect from Chanshan East hillsides to high-dense centre urban areas;
6. Create Green Belt to bring sea breezes to inner areas and improve the air exchange;

# 香港規劃標準與準則 HONG KONG PLANNING STANDARDS AND GUIDELINES

- Breezeway / Air path
- Orientation of Street Grids
- Linkage of Open Spaces
- Non-building Area
- Waterfront Sites
- Building Heights
- Building Disposition
- Shading and greenery

Street parallel to prevailing wind direction: This prime penetration of wind creates passage of the facade of the building.

Street which is perpendicular to the wind direction: The principal air currents could hardly penetrate and would flow above the building roofs or away from the blocks.

Street almost to wind direction at small angle: promotes variation across streets.

### 新政府總部減高度 造價49億

【本報記者潘煒怡報導】港府將於年底就添馬艦政府總部及立法會大樓擴建招標，為爭取立法會支持，當局決定將建築高度上限，由高度上限的160米，降低至130米至160米；港府消息人士指，新政府總部大樓最高是26至32層，以克違維大平山山身樓和維港景觀。港府預料，新政府總部大樓可於2010年落成。

**自由黨民主黨表支持**  
港府將於明年初正式向立法會財政委員會申請撥款49億元，較03年預計的60億元大幅減低；港府消息人士解釋，此舉減低，並非全因新計劃取消立法會城市規劃發展，主要是因應最新式技術價格指標，令致整個預算費約為49億元。  
立法會三大黨中，自由黨及民主黨表示支持添馬艦新政府總部及立法會大樓，即使價錢移至東九龍建築部的民選，亦堅決反對到底。預料在兩大政黨加上獨立議員的支持，對添馬艦政府總部擴建「撐腰」。

特首曾榮耀上月在施政報告中已明言，期望獲續任8年的新政府總部工程盡快上馬；港府將向立法會提交的文件，更大力推銷，指整個工程計劃可提供約2,700個就業職位，合共7.3萬個工作月，當中2,500個職位屬於建築及裝修行業工人，估計可減少失業率長期高企的問題。

**料總部樓高26至32層**  
港府亦強調新總部不會選擇太平山山身樓和維港景觀，故縮短新政府總部的高度上限，降低至130米至160米（429呎至525呎）。政府消息指，以樓面面積5米（16.5呎）計算，預計新政府總部樓高26至32層。為了減低新的建築密度，政府決定放棄興建展覽館，添馬艦工程又會預留「休憩用地」，興建最少兩公頃的文娛設施，當中包括一個國際標準網球場，以及連接中區的海濱長廊。

**07年批標書 2010竣工**  
政府會沿用「設計及建造」方式進行工程，並分兩個階段招標，預計在07年完成招標工作及批出標書，預計2010年完成工程。屆時三司一局的總部將會遷進新大樓。

保護維港行動召集人郭家麒不支持政府新方案，認為政府應向海濱地區保留供市民享用，而「不是給特有效他的皇表」。而建築師學會則希望政府再作諮詢。

**添馬艦政府總部工程時間表**

時間	項目
今年第四季	政府發出招標資格預審文件
明年首季	完成招標第一階段的預審
明年第二季	向立法會財委會申請49億撥款
明年第三季	發出招標文件
07年初	批出標書
2010年	添馬艦政府總部及立法會大樓落成

# Urban Oasis in Central

High urban climatic class (stressed) areas dominate Sheung Wan in general. Heat stress frequency in high urban climatic class areas is about 96 per year.

Now

Maintain low built volume  
Maintain air paths  
Intensify greening  
Create green corridors  
Provide tree shades

Strategy

The nodes (oases) and the inter-connected paths will lower the urban climatic class of the 7 cells by 1, thus reducing heat stress frequency from 96 to 38 per year.
